

(Final) Task 3: Individual Interview (8 marks)

Interview date: October 16 (s.902 📞 9.00-12.00/ s.903 📞 13.00-16.00)

and October 19(s.902 📞 9.00-12.00/ s.903 📞 13.00-16.00)

Note: Students HAVE TO turn on their camera during the individual interview.

Directions: Read the following passages and kindly provide responses to the following questions:

1. Tim Spector says that we all probably have copies of ourselves out in the world. Do you think this is TRUE? Why or why not?

<p>When Neil Richardson retired, he and his wife decided to move to Braintree, a small city northeast of London. Neil didn't know anyone there, but he was still looking forward to starting his new life in a new place.</p> <p>One day, while Neil was in a cafe in town, a customer approached him. The man said, "You look just like John Jemison." Neil didn't know anyone by that name. Then the manager of the cafe saw Neil and said, "Oh, hello John!" Neil explained to both men that he wasn't John. His name was Neil Richardson. He showed them a credit card to prove his identity.</p> <p>It was a simple case of mistaken identity, and people continued to mistake Neil for John. Then about a year later, on a day trip with a local history group, the two men met face-to-face—and Neil finally understood.</p>	<p>They looked almost exactly alike! And, to their surprise, they lived right around the corner from each other.</p> <p>There were other coincidences, too. As young adults, both Neil and John enrolled in the same college (though at different times). Later, they got jobs teaching the same subject: religious education. Both men also fell in love quickly—they each proposed after knowing their future wives for only a week.</p> <p>They both got married and have stayed with the same women for 50 years. And they both write poetry.</p> <p>Tim Spector is a professor of genetics¹ at King's College in London. He has studied a number of people like Neil and John: two people that look alike but are not related. Professor Spector says that most of us probably have two or three copies of</p>	<p>ourselves out there in the world.</p> <p>There's even a website where you can upload a picture of yourself and try to find your double.</p> <p>Look-alikes have met each other at work, at weddings, and even while on vacation. Most people, though, learn about their double from someone else when they say, "I know someone who looks just like you!" What are the chances that you'll actually meet your look-alike, the way Neil and John did? About one in a million, probably. But it's still fun to imagine. 🗣️</p> <p>¹ <i>Genetics</i> is the study of how characteristics are passed from parent to child.</p>

2. You run into a former classmate at a coffee shop, engage in conversation, and decide to exchange numbers. Eventually, you decide to go on a date. Regrettably, the date doesn't go as planned. It becomes evident quite rapidly that there's a lack of chemistry between you two.

From your view, how can you **politely** communicate your choice to discontinue further engagement?

page 54

Unit 4

Nice person, no chemistry

You run into a former classmate at a coffee shop, and you start chatting. You exchange numbers and later, you go out on a date. Unfortunately, things don't go well. You and the other person get along OK, but very quickly you realize that there's no chemistry between you. What should you do? Many people might give up and go home. But experts say there is another option: keep talking. Very often, people are nervous on a first date, and this can make things uncomfortable. Chatting about hobbies, movies, or music, or even telling a funny story, can help you both relax. It might bring you closer together, too. Do it for an hour. Then, if things don't work out, at least you can say that you tried.
